project silver helm

Ali Ezz, 16, Egypt

A wearable LED helmet powered by an ESP32, inspired by Daft Punk's iconic robotic aesthetic. The visor uses LED matrices to display scrolling text, creating a futuristic, interactive identity

✦ Features

- Bluetooth text control (live updates)
- Adjustable brightness levels
- Scroll + static display modes
- Modular LED visor design
- Fully wearable + battery powered

Built with code, LEDs, and questionable sleep decisions

✦ How It Works

The ESP32 receives commands over Bluetooth and parses them into actions (text, brightness, mode). These are rendered in real-time on chained LED matrices across the visor.

✦ Build Stats (small box section)

- Cost: ~$80
- Time: ~1-2 weeks
- Difficulty: Intermediate
- Components: 10+
